### Summary

<b>Product Description</b>	<p>p38 MAP kinase (MAPK), also called RK or CSBP, is the mammalian orthologue of the yeast HOG kinase that participates in a signaling cascade controlling cellular responses to cytokines and stress. Four isoforms of p38 MAPK, p38<math>\alpha</math>, <math>\beta</math>, <math>\gamma</math> (also known as Erk6 or SAPK3), and <math>\delta</math> (also known as SAPK4) have been identified. p38 MAPK is activated by a variety of cellular stresses including osmotic shock, inflammatory cytokines, lipopolysaccharide (LPS), UV light, and growth factors. MKK3, MKK6, and SEK activate p38 MAPK by phosphorylation at Thr180 and Tyr182. Activated p38 MAPK has been shown to phosphorylate and activate MAPKAP kinase 2 and to phosphorylate the transcription factors ATF-2, Max, and MEF2.</p> <p>Rouse, J. et al. (1994) Cell 78, 1027-37.
