Bioinformation

Gene Symbol	FXYP6
Gene Full Name	FXYP domain containing ion transport regulator 6
Background	This gene encodes a member of the FXYP family of transmembrane proteins. This particular protein encodes phosphohippolin, which likely affects the activity of Na,K-ATPase. Multiple alternatively spliced transcript variants encoding the same protein have been described. Related pseudogenes have been identified on chromosomes 10 and X. Read-through transcripts have been observed between this locus and the downstream sodium/potassium-transporting ATPase subunit gamma (FXYP2, GeneID 486) locus.[provided by RefSeq, Feb 2011]
Calculated Mw	11 kDa
Cellular Localization	Membrane; Single-pass type I membrane protein. [UniProt]
