Bioinformation

Gene Symbol	SLC5A2
Gene Full Name	solute carrier family 5 (sodium/glucose cotransporter), member 2
Background	This gene encodes a member of the sodium glucose cotransporter family which are sodium-dependent glucose transport proteins. The encoded protein is the major cotransporter involved in glucose reabsorption in the kidney. Mutations in this gene are associated with renal glucosuria. Two transcript variants, one protein-coding and one not, have been found for this gene. [provided by RefSeq, Feb 2015]
Function	Sodium-dependent glucose transporter. Has a Na(+) to glucose coupling ratio of 1:1. Efficient substrate transport in mammalian kidney is provided by the concerted action of a low affinity high capacity and a high affinity low capacity Na(+)/glucose cotransporter arranged in series along kidney proximal tubules. [UniProt]
Calculated Mw	73 kDa
Cellular Localization	Membrane; Multi-pass membrane protein. [UniProt]
