Bioinformation

Gene Symbol BAG3

Gene Full Name BCL2-associated athanogene 3

Background BAG proteins compete with Hip for binding to the Hsc70/Hsp70 ATPase domain and promote substrate

release. All the BAG proteins have an approximately 45-amino acid BAG domain near the C terminus but differ markedly in their N-terminal regions. The protein encoded by this gene contains a WW domain in the N-terminal region and a BAG domain in the C-terminal region. The BAG domains of BAG1, BAG2, and BAG3 interact specifically with the Hsc70 ATPase domain in vitro and in mammalian cells. All 3 proteins bind with high affinity to the ATPase domain of Hsc70 and inhibit its chaperone activity in a

Hip-repressible manner. [provided by RefSeq, Jul 2008]

Function Inhibits the chaperone activity of HSP70/HSC70 by promoting substrate release. Has anti-apoptotic

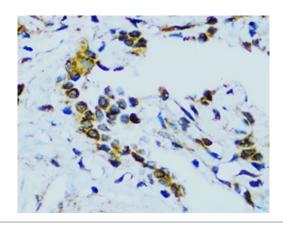

activity. [UniProt]

Calculated Mw 62 kDa

Cellular Localization Nucleus. Cytoplasm. Note=Colocalizes with HSF1 to the nucleus upon heat stress (PubMed:26159920).
