Bioinformation

Gene Symbol	MSRB3
Gene Full Name	methionine sulfoxide reductase B3
Background	The protein encoded by this gene catalyzes the reduction of methionine sulfoxide to methionine. This enzyme acts as a monomer and requires zinc as a cofactor. Several transcript variants encoding two different isoforms have been found for this gene. One of the isoforms localizes to mitochondria while the other localizes to endoplasmic reticula. [provided by RefSeq, Jul 2010]
Function	Catalyzes the reduction of free and protein-bound methionine sulfoxide to methionine. Isoform 2 is essential for hearing. [UniProt]
Calculated Mw	21 kDa
Cellular Localization	Isoform 1: Endoplasmic reticulum. Isoform 2: Mitochondrion. [UniProt]
