Bioinformation

Gene Symbol	CRB1
Gene Full Name	crumbs family member 1, photoreceptor morphogenesis associated
Background	This gene encodes a protein which is similar to the Drosophila crumbs protein and localizes to the inner segment of mammalian photoreceptors. In Drosophila crumbs localizes to the stalk of the fly photoreceptor and may be a component of the molecular scaffold that controls proper development of polarity in the eye. Mutations in this gene are associated with a severe form of retinitis pigmentosa, RP12, and with Leber congenital amaurosis. Alternate splicing results in multiple transcript variants, some protein coding and some non-protein coding. [provided by RefSeq, Apr 2012]
Function	Plays a role in photoreceptor morphogenesis in the retina. May maintain cell polarization and adhesion. [UniProt]
Calculated Mw	154 kDa
PTM	Extensively glycosylated. [UniProt]
Cellular Localization	Isoform 1: Apical cell membrane; Single-pass type I membrane protein. Note=Distributed at the apical membrane of all retinal epithelial cells. Located in the apical membrane of the adherens junction in outer limiting membrane (OLM) of the retina. Isoform 2: Secreted. [UniProt]

Immunohistochemistry: Paraffin-embedded Mouse testis tissue. Antigen Retrieval: Heat mediation was performed in Citrate buffer (pH 6.0) for 20 min. The tissue section was blocked with 10% goat serum. The tissue section was then stained with ARG43054 anti-CRB1 antibody at 1 µg/ml dilution, overnight at 4°C.
