### Bioinformation

<b>Gene Symbol</b>	NFE2L3
<b>Gene Full Name</b>	nuclear factor, erythroid 2-like 3
<b>Background</b>	This gene encodes a member of the cap 'n' collar basic-region leucine zipper family of transcription factors. The encoded protein heterodimerizes with small musculoaponeurotic fibrosarcoma factors to bind antioxidant response elements in target genes. This protein is a membrane bound glycoprotein that is targeted to the endoplasmic reticulum and the nuclear envelope. Pseudogenes of this gene are found on chromosomes 16, 17, and 18. [provided by RefSeq, Mar 2009]
<b>Function</b>	Activates erythroid-specific, globin gene expression. [UniProt]
