Bioinformation

Gene Symbol	FBN2
Gene Full Name	Fibrillin 2
Background	The protein encoded by this gene is a component of connective tissue microfibrils and may be involved

in elastic fiber assembly. Mutations in this gene cause congenital contractural arachnodactyly.

Function	Fibrillins are structural components of 10-12 nm extracellular calcium-binding microfibrils, which occur either in association with elastin or in elastin-free bundles. Fibrillin-2-containing microfibrils regulate the early process of elastic fiber assembly. Regulates osteoblast maturation by controlling TGF-beta bioavailability and calibrating TGF-beta and BMP levels, respectively.
Calculated Mw	315 kDa
PTM	Disulfide bond, Glycoprotein
Cellular Localization	Extracellular matrix, Secreted
