### Bioinformation

Gene Symbol	KLK13
Gene Full Name	Kallikrein Related Peptidase 13
Background	Kallikreins are a subgroup of serine proteases having diverse physiological functions. Growing evidence

suggests that many kallikreins are implicated in carcinogenesis and some have potential as novel cancer and other disease biomarkers. This gene is one of the fifteen kallikrein subfamily members located in a cluster on chromosome 19. Expression of this gene is regulated by steroid hormones and may be useful as a marker for breast cancer.

Calculated Mw	31 kDa
PTM	Disulfide bond, Glycoprotein
Cellular Localization	Secreted
