Bioinformation

Gene Symbol	NSMCE1
Gene Full Name	NSE1 Homolog, SMC5-SMC6 Complex Component
Background	Enables protein dimerization activity and ubiquitin protein ligase activity. Involved in positive regulation of response to DNA damage stimulus. Located in nucleoplasm. Part of Smc5-Smc6 complex. [provided by Alliance of Genome Resources, Apr 2022]
Function	MAGEF1-NSMCE1 ubiquitin ligase promotes proteasomal degradation of MMS19, a key component of the cytosolic iron-sulfur protein assembly (CIA) machinery. Down-regulation of MMS19 impairs the activity of several DNA repair and metabolism enzymes such as ERCC2/XPD, FANCI, RTEL1 and POLD1 that require iron-sulfur clusters as cofactors. [Uniprot]
PTM	Phosphoprotein, Ubl conjugation. [Uniprot]
Cellular Localization	Chromosome, Nucleus, Telomere. [Uniprot]
