Bioinformation

Gene Symbol DRD1

Gene Full Name dopamine receptor D1

Background This gene encodes the D1 subtype of the dopamine receptor. The D1 subtype is the most abundant

dopamine receptor in the central nervous system. This G-protein coupled receptor stimulates adenylyl cyclase and activates cyclic AMP-dependent protein kinases. D1 receptors regulate neuronal growth and development, mediate some behavioral responses, and modulate dopamine receptor D2-mediated events. Alternate transcription initiation sites result in two transcript variants of this gene. [provided by

RefSeq, Jul 2008]

Function Dopamine receptor whose activity is mediated by G proteins which activate adenylyl cyclase. [UniProt]

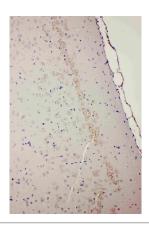

Calculated Mw 49 kDa

Cell membrane; Multi-pass membrane protein. Endoplasmic reticulum membrane; Multi-pass

membrane protein. Transport from the endoplasmic reticulum to the cell surface is regulated by

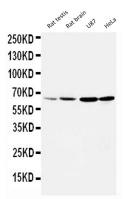

interaction with DNAJC14. [UniProt]
