Bioinformation

Gene Symbol	ETS2
Gene Full Name	v-ets avian erythroblastosis virus E26 oncogene homolog 2
Background	This gene encodes a transcription factor which regulates genes involved in development and apoptosis. The encoded protein is also a protooncogene and shown to be involved in regulation of telomerase. A pseudogene of this gene is located on the X chromosome. Alternative splicing results in multiple transcript variants. [provided by RefSeq, Jan 2012]
Function	Transcription factor activating transcription. Binds specifically the DNA GGAA/T core motif (Ets-binding site or EBS) in gene promoters and stimulates transcription. [UniProt]
Calculated Mw	53 kDa
PTM	Phosphorylation by CDK10 at Ser-220 and Ser-225 creates a phosphodegron that targets ETS2 for proteasomal degradation. [UniProt]
Cellular Localization	Nucleus. [UniProt]
