Bioinformation

Gene Symbol	KRT1
Gene Full Name	keratin 1, type II
Background	The protein encoded by this gene is a member of the keratin gene family. The type II cytokeratins consist of basic or neutral proteins which are arranged in pairs of heterotypic keratin chains coexpressed during differentiation of simple and stratified epithelial tissues. This type II cytokeratin is specifically expressed in the spinous and granular layers of the epidermis with family member KRT10 and mutations in these genes have been associated with bullous congenital ichthyosiform erythroderma. The type II cytokeratins are clustered in a region of chromosome 12q12-q13. [provided by RefSeq, Jul 2008]
Function	May regulate the activity of kinases such as PKC and SRC via binding to integrin beta-1 (ITB1) and the receptor of activated protein C kinase 1 (RACK1). In complex with C1QBP is a high affinity receptor for kininogen-1/HMWK. [UniProt]
Calculated Mw	66 kDa
PTM	Undergoes deimination of some arginine residues (citrullination). [UniProt]
Cellular Localization	Cell membrane. Note=Located on plasma membrane of neuroblastoma NMB7 cells. [UniProt]
