Bioinformation

Gene Symbol OGN

Gene Full Name osteoglycin

Background This gene encodes a protein which induces ectopic bone formation in conjunction with transforming growth factor beta. This protein is a small proteoglycan which contains tandem leucine-rich repeats (LRR). Alternatively spliced transcript variants that encode the same protein have been found for this gene. [provided by RefSeq, Jul 2008]

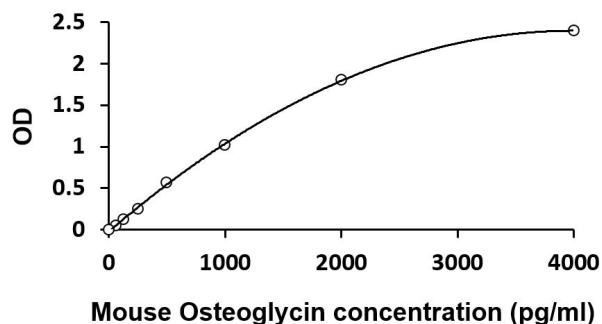

Function Induces bone formation in conjunction with TGF-beta-1 or TGF-beta-2. [UniProt]
