Bioinformation

Gene Symbol CPE

Gene Full Name carboxypeptidase E

Background This gene encodes a carboxypeptidase that cleaves C-terminal amino acid residues and is involved in the biosynthesis of peptide hormones and neurotransmitters, including insulin. It is a peripheral membrane protein. The protein specifically binds regulated secretory pathway proteins, including prohormones, but not constitutively secreted proteins. Mutations in this gene are implicated in type II diabetes. [provided by RefSeq, Jul 2008]

Function Removes residual C-terminal Arg or Lys remaining after initial endoprotease cleavage during prohormone processing. Processes proinsulin. [UniProt]

Cellular Localization Isoform 1: Cytoplasmic vesicle, secretory vesicle membrane; Peripheral membrane protein. Secreted. Note=Associated with the secretory granule membrane through direct binding to lipid rafts in intragranular conditions. Isoform 2: Nucleus. [UniProt]
