Bioinformation

Gene Symbol	FCRL1
Gene Full Name	Fc receptor-like 1
Background	This gene encodes a member of the immunoglobulin receptor superfamily and is one of several Fc receptor-like glycoproteins clustered on the long arm of chromosome 1. The encoded protein contains three extracellular C2-like immunoglobulin domains, a transmembrane domain and a cytoplasmic domain with two immunoreceptor-tyrosine activation motifs. This protein may play a role in the regulation of cancer cell growth. Alternative splicing results in multiple transcript variants. [provided by RefSeq, Apr 2009]
Function	May function as an activating coreceptor in B-cells. May function in B-cells activation and differentiation. [UniProt]
