## Bioinformation

---

Gene Symbol	BCAN
Gene Full Name	brevican
Background	This gene encodes a member of the lectican family of chondroitin sulfate proteoglycans that is specifically expressed in the central nervous system. This protein is developmentally regulated and may function in the formation of the brain extracellular matrix. This protein is highly expressed in gliomas and may promote the growth and cell motility of brain tumor cells. Alternate splicing results in multiple transcript variants. [provided by RefSeq, Sep 2011]
Function	May play a role in the terminally differentiating and the adult nervous system during postnatal development. Could stabilize interactions between hyaluronan (HA) and brain proteoglycans. [UniProt]

PTM	Contains mostly chondroitin sulfate (By similarity). O-glycosylated with a core 1 or possibly core 8 glycan. [UniProt]
Cellular Localization	Isoform 1: Secreted, extracellular space, extracellular matrix. Isoform 2: Membrane; Lipid-anchor, GPI-anchor. [UniProt]
