Bioinformation

Gene Symbol MRC1

Gene Full Name mannose receptor, C type 1

Background The recognition of complex carbohydrate structures on glycoproteins is an important part of several biological processes, including cell-cell recognition, serum glycoprotein turnover, and neutralization of pathogens. CD206 / MMR is a type I membrane receptor that mediates the endocytosis of glycoproteins by macrophages. The protein has been shown to bind high-mannose structures on the surface of potentially pathogenic viruses, bacteria, and fungi so that they can be neutralized by phagocytic engulfment. [provided by RefSeq, Sep 2015]

Function CD206 / MMR mediates the endocytosis of glycoproteins by macrophages. Binds both sulfated and non-sulfated polysaccharide chains.

(Microbial infection) Acts as phagocytic receptor for bacteria, fungi and other pathogens.

(Microbial infection) Acts as a receptor for Dengue virus envelope protein E.

(Microbial infection) Interacts with Hepatitis B virus envelope protein. [UniProt]
