### Bioinformation

Gene Symbol	GGCT
Gene Full Name	Gamma-Glutamylcyclotransferase
Background	The protein encoded by this gene catalyzes the formation of 5-oxoproline from gamma-glutamyl dipeptides, the penultimate step in glutathione catabolism, and may play a critical role in glutathione homeostasis. The encoded protein may also play a role in cell proliferation, and the expression of this gene is a potential marker for cancer. Pseudogenes of this gene are located on the long arm of chromosome 5 and the short arm of chromosomes 2 and 20. Alternatively spliced transcript variants

encoding multiple isoforms have been observed for this gene.

Function	Induces release of cytochrome c from mitochondria with resultant induction of apoptosis.
PTM	Phosphoprotein
Cellular Localization	Cytosol, Extracellular exosome
